

The figure displays a 6x3 grid of brain MRI slices, each showing a different segmentation metric. The rows are labeled as follows:

- Ratio**: Shows the ratio of the segmentation result to the ground truth. The color bar ranges from 0.4 to 0.8.
- Ratio-diff**: Shows the difference between the ratio and the ground truth. The color bar ranges from 0.2 to 0.6.
- Ratio-signed**: Shows the signed ratio of the segmentation result to the ground truth. The color bar ranges from 0.00 to 0.75.
- Ratio-diff-signed**: Shows the signed difference between the ratio and the ground truth. The color bar ranges from 0.0 to 0.4.
- Intersection-union-voxel**: Shows the intersection-union ratio for each voxel. The color bar ranges from 0.25 to 0.75.
- Intersection-union-distance**: Shows the distance between the segmentation result and the ground truth. The color bar ranges from 0.1 to 0.3.

The columns represent different brain slices, showing the spatial distribution of these metrics across the brain volume.

Ratio

This figure consists of three black and white photomicrographs of testis sections, labeled (a), (b), and (c) from left to right. Each image shows a cross-section of a seminiferous tubule. The tubules are filled with developing sperm cells at various stages of maturation, appearing as a dense, granular pattern of cells. The overall structure of the tubules is roughly circular but irregular in shape. The background is dark, and the tubule walls are visible as lighter, more structured borders.
