

The figure displays a 6x3 grid of brain MRI slices, each showing a different segmentation metric. The rows are labeled as follows:

- Ratio**: Shows the ratio of segmented voxels to total voxels. Color bar scale: 0.4 to 0.8.
- Ratio-diff**: Shows the difference in the ratio between two segmentations. Color bar scale: 0.2 to 0.6.
- Ratio-signed**: Shows the signed ratio of segmented voxels. Color bar scale: 0.00 to 0.75.
- Ratio-diff-signed**: Shows the signed difference in the ratio between two segmentations. Color bar scale: 0.0 to 0.4.
- Intersection-union-voxel**: Shows the intersection-union ratio for individual voxels. Color bar scale: 0.25 to 0.75.
- Intersection-union-distance**: Shows the intersection-union ratio for distances. Color bar scale: 0.1 to 0.3.

The columns represent different brain slices, showing the spatial distribution of these metrics across the brain volume.

Ratio

Figure 1 displays a 2x3 grid of brain MRI slices. The top row shows three slices of a healthy brain, and the bottom row shows three slices of a brain with a tumor. A color bar on the right indicates intensity values from 0.1 to 0.3.
